

Third-party Packages Verification Requirements

To submit third-party packages in Synology Package Center, the basic verification process is required. Synology Test Team will go through some basic tests before publishing the package. To make sure the smoothness of the verification process, below items are compulsory.

- ✓ User Manual – the user manual is necessary for us to install and execute the package in Synology NAS.
- ✓ Change Log – the change log is needed when there is a software update.
- ✓ Major features – developers should list all main features of the package, with detailed information.
- ✓ Checklist – developers should provide the basic checklist, and this checklist must be verified themselves first. Synology will go through the checklist again.
- ✓ Test Log – provide the location of the system log, so that our test team can provide the log to developers if needed.
- ✓ Test account/username – any test account/username should be provided for verifying the package.

Any queries, please contact Max <maxwu@synology.com>
